10.6 The DNA genotype is expressed as proteins, which provide the molecular basis for phenotypic traits. A gene is a sequence of DNA that directs the synthesis of a specific protein. –DNA is transcribed into RNA –RNA is translated into protein. The presence and action of proteins determine the phenotype of an organism.

Molecular genetics, the study of gene structure and function, has been among the most prominent sub-fields of molecular biology since the early 2000s. Other branches of biology are informed by molecular biology, by either directly studying the interactions of molecules in their own right such as in cell biology and developmental biology, or
